

Scale-nested conformal prediction on the Markov-stability hierarchy

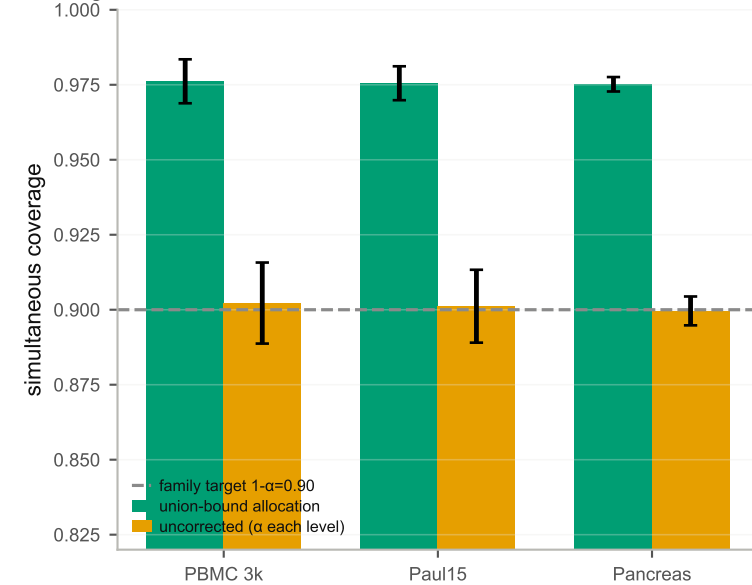

a Markov co-clustering taxonomy (pancreas)

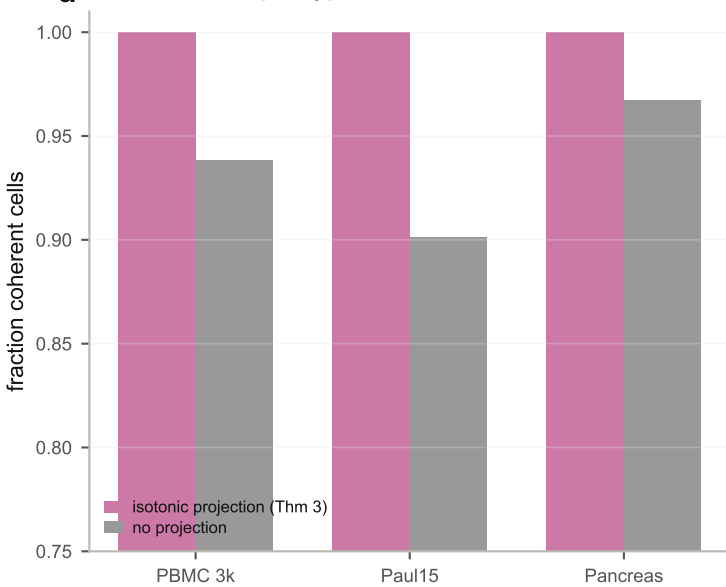

b Per-scale coverage holds; a rare type under-served at fine scale is rescued coarse

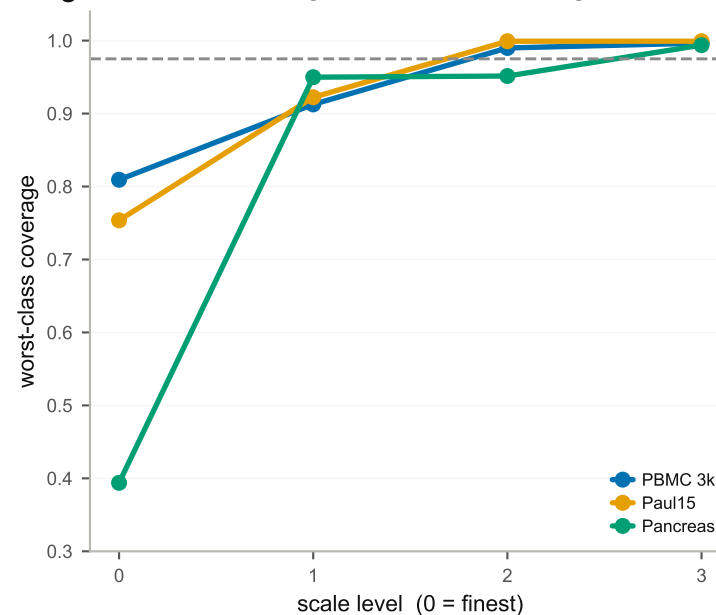

c Family-wise guarantee: the allocation buys a safety margin

d Coherence: fine calls never contradict their coarse super-type

e Rare-type rescue generalizes: worst-class coverage rises with coarsening

f Sets stay compact; the continuum (Paul15) carries the most residual ambiguity
